

Homework 5

CMSY-217, Fall 2011

The source code for this assignment must be submitted electronically using the Canvas course website prior to the start of class on Thursday, November 24.

The Social Security Administration provides a webpage (<http://www.ssa.gov/OACT/babynames>) with two interactive applications that allow you to display the most popular baby names for a selected year and track the popularity of a selected baby name over several years. The data are based on Social Security Card applications for years 1880 through 2010.

Top 10 Names for 2010			
Rank	Male name	Female name	
1	Jacob	Isabella	
2	Ethan	Sophia	
3	Michael	Emma	
4	Jayden	Olivia	
5	William	Ava	
6	Alexander	Emily	
7	Noah	Abigail	
8	Daniel	Madison	
9	Aiden	Chloe	
10	Anthony	Mia	

Popularity of the female name Chloe		
Year of birth	Rank	
2010	9	
2009	9	
2008	10	
2007	16	
2006	18	
2005	19	
2004	23	
2003	24	
2002	25	
2001	30	
2000	38	
Note: Rank 1 is the most popular, rank 2 is the next most popular, and so forth. Name data are from Social Security card applications for births that occurred in the United States.		

The data have been placed in a Java DB (Apache Derby) database named **babynames** with a table for each year of birth that contains columns for name, sex, and number of births. Each table is named with the letters YOB followed by the four-digit year for which the data was collected. For example, the table YOB2010 contains the data for year 2010. Note that each name entry in these tables begins with a capital letter and is followed by all lowercase letters.

```
ij> DESCRIBE YOB2010;
COLUMN_NAME          | TYPE_NAME
-----
NAME                  | VARCHAR
SEX                   | CHAR
NUMBER                | INTEGER
```

There is also a table called TOTALBIRTHS which contains the total number of births, by gender, for each year.

```
ij> DESCRIBE TOTALBIRTHS;
COLUMN_NAME          | TYPE_NAME
-----
BIRTHYEAR            | INTEGER
MALE                  | INTEGER
FEMALE               | INTEGER
```

The `BabyNames` class contains a Swing application that provides you with a graphical user interface (GUI) similar in appearance to the HTML forms on the Social Security website. In addition, the event-handling code has been written so that when the user clicks the **Go** button - a `BabyNamesQuery` object is created, the input parameters are passed to the `getList` or `getRank` method, and a results `String` is returned which is displayed in the `JTextArea` at the bottom of the GUI. The following figure shows the `BabyNames` application running with the results of a `getList` method call displayed.

Baby Names

Popular Names by Birth Year

For a list of the most popular names for a particular year of birth (any year after 1879), enter the year and the length of the popularity list.

Enter year of birth: **Go**

Popularity: **Reset**

Name ranking may include:

☐ Percent of total births
☐ Number of births
☒ Neither

Popularity of a Name

See how popularity of a name has changed over time!

Name? **Go**

Do not use spaces, hyphens, or other non-alphabetic characters in the name. **Reset**

Sex associated with name

☐ Male ☐ Female ☒ None

Number of years?

1	Jacob	Isabella
2	Ethan	Sophia
3	Michael	Emma
4	Jayden	Olivia
5	William	Ava
6	Alexander	Emily
7	Noah	Abigail
8	Daniel	Madison
9	Aiden	Chloe
10	Anthony	Mia
11	Joshua	Addison
12	Mason	Elizabeth
13	Christopher	Ella
14	Andrew	Natalie
15	David	Samantha
16	Matthew	Alexis
17	Logan	Lily
18	Elijah	Grace
19	James	Hailey
20	Joseph	Alyssa

1. Write the `getList` method in the `BabyNamesQuery` class using JDBC to provide the same functionality as the **Popular Names by Birth Year** application on the Social Security website.
2. Write the `getRank` method in the `BabyNamesQuery` class using JDBC to provide the same functionality as the **Popularity of a Name** application on the Social Security website.

The following SQL statements are examples of the `String` query objects that you could pass to the `executeQuery` method of the `Statement` interface to return a `ResultSet` object. Figure 28.23 from the textbook would be a good starting point for the necessary Java code.

```
SELECT NAME
  FROM YOB2010
 WHERE SEX='M'
 ORDER BY NUMBER DESC, NAME ASC
 FETCH FIRST 20 ROWS ONLY
```

```
SELECT NAME, NUMBER
  FROM YOB2010
 WHERE SEX='M'
 ORDER BY NUMBER DESC, NAME ASC
 FETCH FIRST 20 ROWS ONLY
```

```
SELECT MALE
  FROM TOTALBIRTHS
 WHERE BIRTHYEAR=2010
```

```
SELECT NUMBER
  FROM YOB2010
 WHERE NAME='Chloe' AND SEX='F'
```

```
SELECT COUNT (NAME)
  FROM YOB2010
 WHERE SEX='F' AND NUMBER > 11656
 OR SEX='F' AND NUMBER = 11656 AND NAME<='Chloe'
```
